LEVAL by Busch + Müller: The curve light assistant for e-bikes

With the world novelty LEVAL, the curve light assistant by Busch + Müller, e-bike lighting is always held where it is needed: Far ahead on the road.

Modern high output e-bike headlights cast a large and homogenous light field - but only as long as one cycles straight ahead. During every turn, the steering movement turns the headlight sideways, while at the same time, the e-bike leans in the same direction. Because of this, the light field tilts left or right and to the front. As a result, practically no light shines onto the road ahead.

LEVAL instantaneously compensates every turn and inclination of the e-bike, no matter if it is a long drawn-out curve or a sharp turn. The upper edge of the light field (light/dark boundary) stays level and at the same height. This light edge wanders along the horizon, smoothly and agreeably to the eye, for LEVAL has septuplicate ball bearings.

A light system equipped with LEVAL "thinks". No later than in the third curve, the cyclist's gaze no longer instinctively dips, but safely stays on the horizon. Where the ride is going. Where, thanks to LEVAL, there now is light.

LEVAL is a patented and electronically controlled adaptor that, like customary headlight mounts, is installed between headlight and e-bike. For connection to 5-15 V DC power supply.

LEVAL, type 365

German SRP €74.90

Available autumn/winter 2021/2.
