BREX by Busch + Müller:

The rear light with brake light and emergency brake light function

The world novelty BREX, the brake light/emergency brake light system by Busch + Müller, significantly increases safety and visibility of e-cyclists.

In normal operation, the tried and tested, bright LineTec strip light shines and provides premium protection at any time.

The integrated sensor technology registers every brake application. Then, the light strip shines even more brightly and noticeably, warning other traffic participants of the deceleration.

NEW: In case of an abrupt full brake application, the brake light steps up one more level into the brightly pulsating emergency brake light mode. In this mode, BREX conveys the suddenly dangerous situation with an unprecedented signalling effect, actively preventing accidents.

Convenient: BREX works automatically. In contrast to conventional brake rear lights, no separate cable connection to the brake lever needs to be established.

Approved according to the most recent German road traffic regulations.

- BREX opens up a new safety dimension for e-bikes.
- BREX reacts smartly in critical situations in which humans are only able to act instinctively.
- BREX makes driving in a column more safe and prevents grievous rear-end collisions.
- BREX is available in autumn of 2021 in the rear light model TOPLIGHT LINE brex.

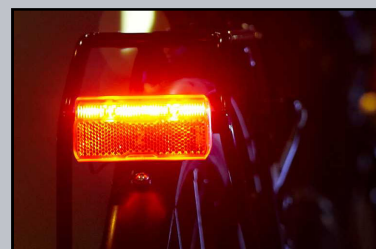

TOPLIGHT Line brex, type 323KSB

German SRP €49.90

Available autumn 2021.
